What does one prediction consume?
rows of features
well tests, logs by depth
linear models, trees, boosting first
MLP for large data or embeddings
ML 1–2, Days 1–3
images or grids
seismic, borehole images
CNN, starting from transfer learning
check augmentations are physical
Day 4
ordered sequences
sensors, production, load
baselines, then lag features + boosting
RNN / TCN; transformer for long context
Day 5
documents
reports, procedures
retrieval + language model
answers checked against sources
Day 5
